LIST OF TABLES

1.1. Status of shifting cultivation in India.
1.2. Status of shifting cultivation in Northeast India.
1.3. Loss/gain in forest covers in Northeast India during 1995-1997 (sq km).
1.4. Conventional versus three year cropping shifting cultivation practice.
3.1. Area under rice in Manipur.
3.2. Extent of shifting cultivation rice (percentage of geographical area) in Manipur.
3.3. Area and production of rice and maize in Ukhrul district, Manipur.
3.4. Basic details of the study villages in Ukhrul district, Manipur.
3.5. Agricultural land use in the study villages of Ukhrul district, Manipur.
4.1. Variety of shifting cultivation practices among the Tangkhuls of Ukhrul district, Manipur.
4.2. Calendar of agricultural activities in shifting cultivation practice of the Tangkhuls in Ukhrul district, Manipur.
4.3. Crop zonation in a shifting cultivation field of the Tangkhuls in Ukhrul district, Manipur.
4.4. Major constraints of longer cropping among the Tangkhuls of Manipur (n=80).
5.1. Crop diversity in different cropping years of shifting cultivation practice among the Tangkhuls of Ukhrul district, Manipur.
5.2. Sequential harvesting (sowing-harvesting) calendar.
5.3. Major crops of each cropping year.
5.4. Output ratio (*) of major crops in different cropping year.
5.5. Yield of major crops in different cropping years (kg ha⁻¹ yr⁻¹).
5.6. Seed/propagule input and monetary value for different cropping years.
5.7. Labour input for different cropping years.
5.8. Cost benefit analysis (Rs ha⁻¹ yr⁻¹) of different cropping years.
6.1. Weed composition and density just prior to a weeding during different cropping years of shifting cultivation practice among the Tangkhuls of Ukhrul district, Manipur (mean ± se).
6.2. Percentage contributions of each weed species to the total density of different weeks after the previous weeding of different cropping years.
6.3. Magnitude of weed biomass at different weeks and biomass brought back into the system during different cropping year.
7.1. Physical properties of summer soils during different cropping years of shifting cultivation in Ukhrul district, Manipur.
7.2. Chemical properties of summer soils during different cropping years.
7.3. Summary of t-Test for summer soils that have significant variation during different cropping years.
7.4. Chemical properties of winter soils during different cropping years.
7.5. Summary of t-Test for winter soils that have significant variation during different cropping years.
7.6. Comparison of nutrient status between summer and winter seasons during different cropping years.
7.7. t-Test for temporal changes (summer and winter) in the soil chemical properties of different cropping years.

7.8. ANOVA summary for soil status during summer at different slopes of different cropping years (mean ± se as histogram is shown in Figure 7.1).

7.9. ANOVA summary for soil status of different slopes during winter of different cropping years (mean ± se as histogram is shown in Figure 7.2).

7.10. t-Test summary for summer and winter soils of respective slopes for different cropping years.

7.11. Farmers' characterization of local soil types.

7.12. Farmers' common crops and their best soil types (with respect to crops).

7.13. Physical properties of traditional soil types.

7.15. Nutrient status of shifting cultivation soil in the Northeastern region of India.

8.1. Plot size, trees and shrubs retained in shifting cultivation fields of the Tangkhuls in Ukhrul district, Manipur.

8.2. Ecological significance, uses and management details of trees and shrubs retained during slashing and cultivation phase of shifting cultivation fields among the Tangkhuls of Ukhrul district, Manipur.

8.3. Density and basal area of trees and shrubs retained at different fallow aged villages/fields (ha⁻¹).

8.4. Similarity index of species (%) at different fallow aged villages/fields.

8.5. Preference of fallow vegetation in relation to crops to be grown.

8.6. Preferred species of each utility category and their importance.

9.1. Calendar of activities in fireless (slash and unburn) shifting cultivation of the Tangkhuls in Ukhrul district, Manipur.

9.2. Weed composition and density just prior to a weeding during different cropping years (mean ± se).

9.3. Percentage contributions for each weed species to total density at different weeks of different cropping years.

9.4. Weed magnitude at different weeks and biomass input back into the system during different cropping years.

9.5. Crop diversity in different cropping years.

9.6. Output ratio (*) of major crops in different cropping years.

9.7. Yield of major crops in different cropping years (kg ha⁻¹ yr⁻¹).

9.8. Seed input and monetary value for different cropping years.

9.9. Labour input for different cropping years.

9.10. Cost benefits analysis (Rs ha⁻¹ yr⁻¹) of different cropping years.

9.11. Physical properties of soils of different cropping years.

9.12. Chemical properties of soils of different cropping years.

9.13. t-Test summary for comparative account of soil chemical properties between slash and burn and fireless (slash and unburn) shifting cultivation of the Tangkhuls.

9.14. Comparative account of yield parameters between shifting cultivation with fire (slash and burn) and fireless (slash and unburn) shifting cultivation of the Tangkhuls.
