TABLES

Table 1- Volume equations presently in use in Indian forestry

Table 2- Growing stock volume of each plot from study area

Table 3- Radiance and radiance ratio values for urban scene

Table 4- Ground and Satellite data of study area

Table 5- Forest type of Gund study area

Table 6- Ground inventory field data from study area

Table 7- Actual Models as derived from the data

Table 8- Ranking of models on the basis of $R^2$

Table 9- Field and satellite data of validation plots

Table 10 - Comparative observed & estimated volume per plot for various models

Table 11- Ranking of models on the basis of $R^2$, RMSE and standard deviation

Table 12 - Analysis of variance table

Table 13 - Value of F- ratio for various models

Table 14 - Validation plots data

Table 15 - Inventory results - growing stock per hectare - moist deciduous forests

Table 16 - Inventory results - growing stock per hectare - evergreen / semi evergreen forests
Table 17 - Expected volume per hectare - moist deciduous forests

Table 18 - Expected volume per hectare - evergreen / semi evergreen forests

Table 19 - Information available with forest department

Table 20 - Volume per plot from remote sensing as compared to field volume

Table 21 - Mean volume per hectare for inventory and R S models and their variances

Table 22 - R² of combination of inventory and R S models

Table 23 - Comparison of cost effectiveness of inventory and R S models

Table 24 - Degree of association among predictor variables

Table 25 - Degree of correlation between volume of biomass and predictor variables

Table 26 - Vol. - VI for field plots

Table 27 - Vol. - NDVI for field plots

Table 28 - Vol. - Ave height for field plots

Table 29 - Vol. - Ave crown % for field plots

Table 30 - Grey level data of band 1 & 2 of satellite data of study area
### Table 31 - Grey level data of band 3 & 4 of satellite data of study area

### Table 32 - Grey level data of VI & NDVI of satellite data of study area
