CONTENTS

CHAPTER I: Introduction

CHAPTER II: Electrochemical investigations of bioactive compounds at glassy carbon electrode

Section A Electrochemical investigations of an immunosuppressant mycophenolate mofetil and its assay in pharmaceutical formulations

Section B Voltammetric determination of methdilazine hydrochloride and isothipendyl hydrochloride based on their oxidation at glassy carbon electrode

CHAPTER III: Multiwalled carbon nanotube based sensors for bioactive compounds

Section A Electrochemical behavior of almotriptan and its determination at multiwalled carbon nanotubes film modified electrode

Section B Electrochemical oxidation and determination of isothipendyl hydrochloride at an electrochemical sensing film constructed by multiwalled carbon nanotubes

CHAPTER IV: Electrochemically reduced graphene oxide based sensors for the assay of drugs

Section A Eco-friendly reduction of graphene oxide and its application as an electrochemical sensor for mycophenolate mofetil

Section B Fabrication and application of electrochemically reduced graphene oxide film coated glassy carbon electrode for valganciclovir

CHAPTER V: Electrochemical oxidation and determination of linezolid at electroreduced graphene oxide-sodium bentonite composite film modified electrode

CHAPTER VI: Electrochemically reduced graphene oxide nanoribbons: facile synthesis and efficient electrochemical sensing of pramipexole
