</table>
5.11 Droplet heating with convection .................................................. 100
5.12 Emission characteristics of n-heptane droplet ($D_0 = 100$ microns) burning at 1 atmosphere and 298 K .................................................. 102
5.13 Effect of ambient pressure $P_\infty$ on burning constant $k_b$ for n-heptane .......................................................... 107
5.14 Ambient pressure effect on droplet lifetime ......................... 108
5.15 Mass burning rate .......................................................... 108
5.16 F/D ratio .......................................................... 109
5.17 Vapour-liquid phase equilibrium compositions predicted by Redlick-Kwong EOS for n-heptane-nitrogen system at ambient pressure of 13.7 bar .................................................. 110
5.18 Vapour-liquid phase equilibrium compositions at sub and supercritical pressures .................................................. 111
5.19 n-heptane vapour mass fraction variation with droplet temperature at different pressures .................................. 112
5.20 Vapour-liquid phase equilibrium compositions for $\text{O}_2/\text{H}_2$ system at sub and supercritical pressures .................................. 113
5.21 Oxygen vapour mass fraction variation with droplet temperature at various pressures .................................. 114
5.22 Square of dimensionless droplet diameter versus time for $\text{Re}_g = 100$ .................................................. 115
5.23 Vaporisation rate at different times for $\text{Re}_g = 100$ .......... 116
5.24 Effect of ambient temperature $T_\infty$ on adiabatic flame temperature .................................. 118
5.25 Burning constant .......................................................... 118
5.26 Droplet lifetime .......................................................... 119
5.27 Droplet mass burning rate ................................................. 119
5.28 NO concentration variation with dimensionless flame radius at different ambient temperatures for n-heptane ................. 120
5.29 $\text{CO}_2$ concentration .......................................................... 121

xi
5.30 CO concentration .................................................. 121
5.31 H₂O concentration .................................................. 121
5.32 Effect of ambient oxidiser concentration Y₀,∞ on flame temperature for n-heptane ........................................ 123
5.33 Effect of ambient oxidiser concentration on burning constant for ethanol ........................................ 123
5.34 Burning constant for n-heptane ................................. 124
5.35 Droplet lifetime ....................................................... 124
5.36 Mass burning rate .................................................... 124
5.37 Variation of (D/D₀)² with t/D₀² for n-heptane droplet burning in (30 % O₂/ 70 % Helium) atmosphere ....................... 125
5.38 Effect of variation of initial droplet diameter D₀ on droplet lifetime at different reduced pressures for n-heptane 127
5.39 Droplet mass burning rate ........................................ 128
5.40 Initial droplet diameter effect on lifetime at different ambient temperatures .................................................. 128
5.41 Droplet mass burning rate ........................................ 128
5.42 Initial droplet diameter effect on lifetime at different ambient oxidiser concentrations ........................................ 129
5.43 Droplet mass burning rate ........................................ 129
5.44 Variation of flame diameter with dimensionless time for different initial droplet size (20 to 5000 microns) .......... 130
5.45 Flame diameter versus dimensionless time for D₀ ranging from 20 to 500 microns ..................................... 130
5.46 Square of dimensionless droplet diameter versus time ...... 131
5.47 Flame standoff distance variation with time ...................... 131
5.48 Effect of fuel properties on the variation of dimensionless flame diameter with dimensionless time ...................... 133
5.49 Effect of fuels on F/D ratio behaviour with dimensionless time 133
5.50 Flame standoff distance versus time ........................................ 134
5.51 Dimensionless droplet diameter squared against time ........... 134
5.52 Droplet mass burning rate ..................................................... 135
5.53 Variation of CO concentration with dimensionless flame radius for a 100 micron fuel droplet burning in standard atmosphere 137
5.54 CO₂ concentration ............................................................... 137
5.55 NO concentration ............................................................... 137
5.56 H₂O concentration .............................................................. 138
5.57 Variation of liquid heptane mass fraction in heptane-dodecane droplet with dimensionless radius at a particular time ...... 140
5.58 Heptane liquid surface mass fraction variation with dimensionless time ......................................................... 141
5.59 Vaporisation of hexane-decane droplet (effect of mixing) 142
5.60 Effect of Lewis number ......................................................... 143
5.61 Vaporisation behaviour of heptane-dodecane droplet (comparison of present model with Law and Law model [23]) 145
5.62 Comparison of multicomponent droplet vaporisation models 145
