

## CHAPTER – III

# ESTIMATION OF ENERGY REQUIREMENTS IN CASHEW NUT PROCESSING INDUSTRIES

### 3.1 Introduction

Cashew is an important cash crop with a rich source of protein (21.2 %), carbohydrates (22 %), fat (47 %) and minerals (Calcium, Phosphorous and Iron) [70]. Cashew tree is polygamous, tropical and subtropical and evergreen. It ranges in size from a small shrub in poor dry soil to a tree of 40 feet height in fertile soil and humid climate [71]. India is among the largest processor of cashew nuts, next to Vietnam, Nigeria and Ivory Coast. The current production in the country accounts for 17% of the global production [72]. Also most of the cashew processing is carried out in small and medium units at rural level. The cashew process industry in India is largely an export-oriented which employs a great number of women to process the nuts. More than 70 percent of cashew cultivation is carried out by small and marginal farmers [73]. Cuddalore district in Tamil Nadu state was considered to have the maximum area and production of cashew than other cashew production districts in the state [74]. Cashew nut processing demands high labour and fuel requirements. The energy consumption for cashew nut processing to produce same quantity of similar products revealed wide variation in energy intensity, ranging from 4.43 to 8.66 kg of fuel wood per kilogram of kernel [75].

The increasing cost of energy has caused the food industry to examine means of reducing energy consumption in processing. The study was conducted to estimate the energy consumption of three cashew processing industries using the energy audit tool with the following objectives:

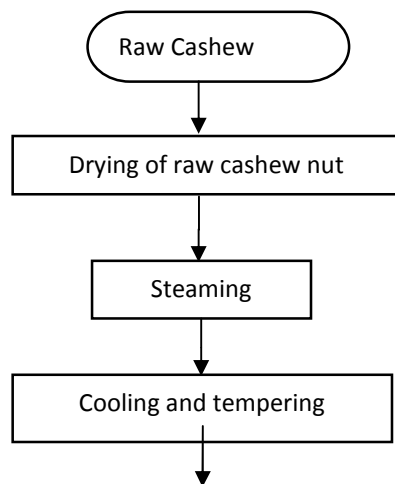

- To estimate the source wise energy consumption in unit operation of small-scale cashew processing industries.
- To quantify the energy utilization and estimate the energy intensity of cashew processing operation.
- To identify the disparities in the production of same quantity in cashew nut processing industries.
- To establish the relationship between energy consumed and energy production in cashew nut processing industries.

- To explore the possibilities of substitution of renewable energy based dryers in place of conventional dryers.

Atul mohod et al. [76] conducted a study for the estimation of energy consumption of eight units operation of small scale cashew nut processing industries in India. Among the eight unit operation, cashew nut drying, cashew nut steaming and drying of cashew kernels are identified as energy intensive processes. These processes consume 90% of the total energy consumption. Mohod et al [77] carried out energy analysis of baby boiler for steaming of cashew nut seeds. Solar energy, electricity and fuel are the major source of energy consumed for cashew nut processing.

Finally the results showed that while using electricity in the baby boiler for the steaming operation, for 60, 30 and 15 kg batch capacity industries, their corresponding total energy was estimated at 5321.43, 5540.14 and 6061.34 MJ. These are the only literature available for energy conservation study of cashew nut industries in India. However the above study is done in Maharashtra state. The present study is carried out in Tamilnadu state to know the variation in energy consumption pattern of cashewnut processing industries.

Cashew nut processing in India depends upon variety of raw materials, location, technological mechanization and availability of energy supply. The processing steps include drying of raw nuts, steaming the raw nuts, cooling, cutting to separate shell from kernel, drying the kernel, peeling, grading and packing.

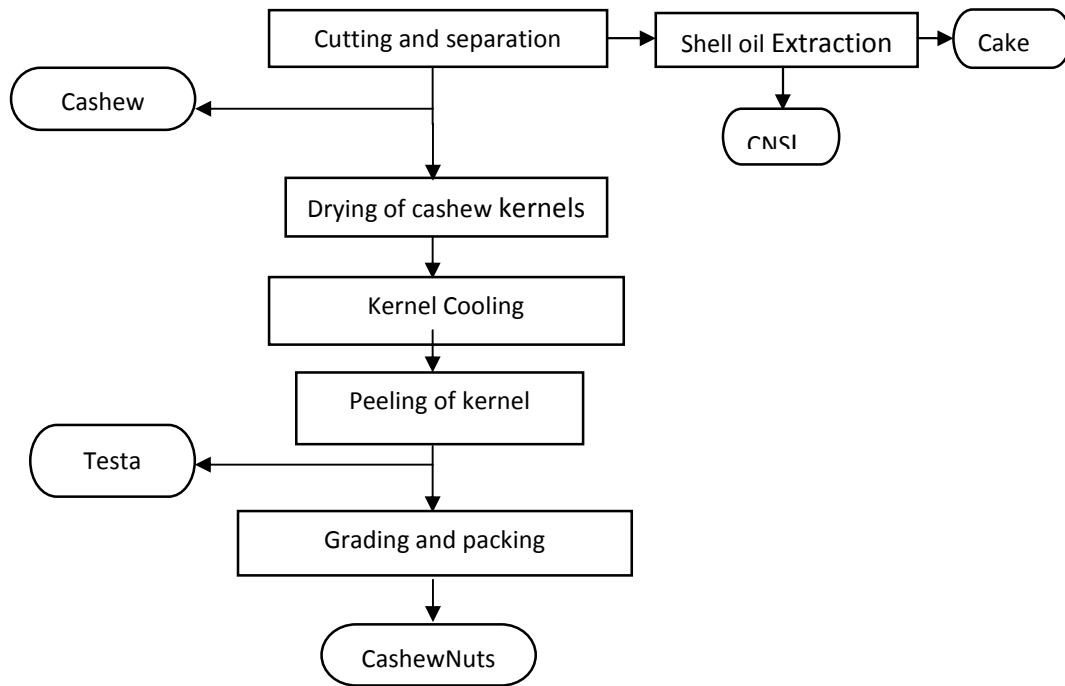

Fig. 3.1. Flow chart for various processes for drying cashew kernel

Based on the drying of cashew kernels, the cashew processing industries were categorized as electrical, biomass and steam based industries. The main objective of cashew nut processing is to remove the valuable cashew kernel from the nut shell with little damage of cashew kernel. Fig. 3.1 and Fig. 3.2 shows the various stages of cashew nut processing.

Drying of raw nuts

Steaming

Cooling & Tempering

Cutting & Separation

Drying of Kernels

Cooling

Peeling

Grading & Packing

Fig. 3.2. Various processes for drying cashew

**Raw cashew nuts:** In raw state, the shell of the nut is leathery, not brittle. It contains thick vesicant oil. A thin testa skin surrounds the kernel. Cashew nut shell liquid (CSNL) is an important industrial raw material for resin manufacture and decorticating operation.

**Drying of raw cashew nut:** The raw cashew nut is dried for three days in open sun drying.

**Steaming:** After drying the raw cashew nut sent for steaming process. The raw nuts are steamed at a pressure of 4.5-5 Kg/cm<sup>2</sup> for 20-30 minutes and then allowed to cool down for 24 hours.

**Cutting and separation of shell:** The shell can be cracked either manually, using a hammer or mechanically. Care must be taken while breaking the kernel and then during the separation of shell.

**Drying of kernel:** Once the kernel is removed from the shell, it is dried because kernel consists of brown layer at the outside known as "Testa". Drying takes usually six hours at temperature of around 65-70°C.

**Kernel cooling:** To bring down the hot temperature during drying process the kernel cooling process is carried out.

**Peeling of kernel:** The cooled kernels undergo peeling process. During this stage the testa is loosely attached to the kernel. Peeling of testa is done manually i.e., gently rubbing with fingers. Some testa will not be removed during the gentle rubbing and to overcome this, the testa is removed using knife.

**Grading and packing:** Grading specifications (CEPC- cashew export & promotion council, India) are adopted for grading the cashew kernels. After grading, the quality of the kernel is checked and the packing process is carried out.

## **3.2 Materials and Methods**

### **3.2.1 Data Collection:**

The primary data was collected from three small scale cashew processing industries located in the Panruti taluk of Cuddalore district, Tamilnadu, India (Fig. 3.3.).The total geographical area of the district is 3678 square kilometre with coastal line of 68 kilometre (Latitude 15 ° 11' and 12 ° 35' Longitude 78 ° 38' and 80° 0 ').The district has around 250-300 household cashew processing units, 25-30 medium sized export oriented units and 5 major large scale export oriented units. The details of the processing units are listed in the Table 3.1.

Fig. 3.3. Location of Cashew processing industries in Cuddalore district

|---|---------------------------|---------|------|

### 3.2.2 Energy utilization/Quantification in various unit operations

The energy consumption in cashew processing industry can be calculated based on the energy consumed in each unit operation expressed in an equivalent energy unit per kg of product. All materials and energy input (thermal, electrical, manual and solar energy) for each unit operation is collected in standard format as per Table3.1.

### 3.2.3 Energy analysis

The following equations were employed to calculate energy consumption pattern of cashew nut processing industries. Unit operations considered were seed drying, steaming, cooling and tempering, cutting and separation, drying of kernels, cooling of kernels, peeling of testa, grading and packaging. The energy input at each stage of unit operations are expressed in terms of electrical, thermal and manual energy.

$$\text{Electrical Energy, } E_p = KPt_e \quad (3.1)$$

$$\text{Thermal Energy, } E_f = C_f W_f \quad (3.2)$$

$$\text{Manual Energy, } E_m = 0.075N_p \quad (3.3)$$

$$\text{Solar Energy, } E_s = I_{sc} AT_s \quad (3.4)$$

$$\text{Total energy consumption} = E_{DR} + E_{SR} + E_{CT} + E_{CS} + E_{DK} + E_{CK} + E_{PK} + E_{GP} \quad (3.5)$$

### 3.2.4 Specific Energy Consumption (SEC)/Energy Intensity (EI)

SEC is the energy consumed per unit (kW-hr) of production or energy per rupee of production. Energy intensity is the ratio of energy consumption (kW-hr) to the unit production (kg) or quantity of energy required per unit of the product. It is the measure of energy efficiency of the product.

$$\text{SEC} = E_c / P_r \quad (3.6)$$

$$\text{EI} = E_c / P_r \quad (3.7)$$

### 3.2.5 Processing Cost (PC)

$$\text{PC} = \text{EI} \times (\text{Electricity cost} / (\text{kW-hr})) \quad (3.8)$$

## 3.3 Results and discussion

### 3.3.1 Material and Energy flow

Material input and output in each unit operation are measured from the cashew processing units. Also the energy input and fuel used for various operations are listed. The data obtained from the detailed energy audit of the three cashew processing industries are summarized in Table.3.2.

Table 3.3. Materials and Energy flow pattern in three different industries

---

Most of the energy and time are spent for drying of raw nuts, steaming of nuts and kernel drying.

### 3.3.2 Energy consumption pattern

The energy requirement for drying of raw nuts, steaming of raw nuts, cooling of nuts, cutting and separation, cashew kernel drying, cooling of cashew kernel, peeling of cashew kernel, grading and packaging were 3879MJ, 1287 MJ,12MJ, 71MJ,577MJ, 3MJ, 25MJ, 7MJ respectively in steam based cashew processing unit. Thus the total energy consumption for processing 1000 kg of raw cashew nut was 5866.2 MJ which is equivalent to 5.8 MJ/kg. Similarly the total energy consumption of other two cashew processing units was found to be 5911.69 MJ and 6897.36 MJ. The total .energy consumption of the three industries are shown in Table3.3-3.5. The following three unit operations are identified as energy intensive viz sun drying of raw nuts, steaming of raw nuts and drying of cashew kernel. Since solar energy is freely available, the energy cost associated with the sun drying of raw nuts is negligible. Steaming of raw cashew nuts contributes about 23%, 21% and 16% of the total energy consumption in the above three processing units.

Table 3.4. Total Energy Consumption of electrical based drying industries

Type of industry: Electrical drying of cashew kernel (MJ/1000kg raw nuts/ 180 kg batch)

| Unit operation           | Solar   | Biomass | Electrical | Manual | Total   |

kernels contributes to about 9.8 %, 7.6 % and 7.42% of the total energy consumption in the above three processing units. There is ample scope of energy conservation/savings through renewable energy systems. The cost of drying per unit of the product is varying between Rs 4-5/kg .Renewable energy based drying systems like solar drying and hybrid drying can contribute to the reduction in drying cost.

### 3.3.3 Energy intensity/Specific Energy Consumption:

The comparisons of total energy consumption in each unit operation of three industries are presented in Fig. 3.4. Energy analyses were carried out to predict the energy intensity and specific energy consumption (SEC) variation in these industries. SEC ranges from 8 kW-hr/kg of cashew kernel to the maximum of 10.64 kW-hr/kg. The high level of energy consumption may be due to the non-utilization of the installed capacity. However the energy cost associated with the processing of cashew nut may be comparatively lesser than the value of end product. Most of these industries perform steaming operation with burning of wood and electricity. The specific energy consumption of steaming and cashew kernel drying can be reduced by use of energy efficient equipments, alternative technologies, energy conservation and fuel switching. Efficient usage of fuel and renewable energy based drying system can contribute to the reduction of production costs.

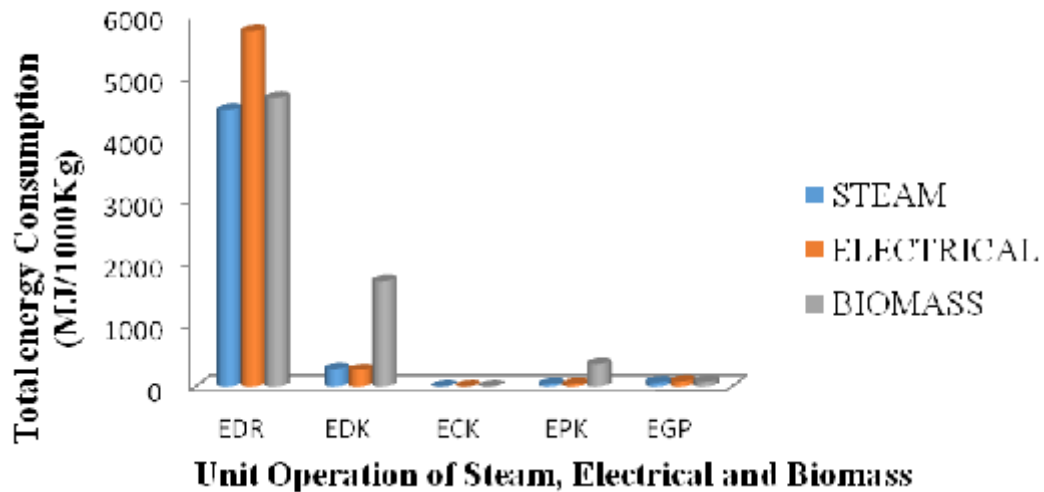

Fig. 3.4. Comparison of Total energy consumption

### 3.4 Conclusion

The following important conclusions are drawn from the case study of energy audit of cashew nut processing industries.

- Energy intensity for the production of cashew kernel was estimated to be 265.68 MJ, 448 MJ and 510 MJ for electrical, steam and biomass based industries respectively.
- Difference of 356 MJ, 786 MJ and 1342 MJ was observed among Industries with same production capacity of 1000 kg raw nut.
- The difference in energy intensity may be attributed to the fuel source, processing method and processing equipment.
- Energy required to process 1000kg of cashew kernel into cashew nuts was 300MJ.
- There is a vast potential of meeting the energy requirement of cashew processing industries through renewable energy based technologies.
