9. SCOPE FOR FURTHER RESEARCH

In recent years many chemicals and drugs such as alcohol, carbon tetrachloride, ioniazid, paracetamol, D-galactosamine, thioacetamide, Rifampicin etc. cause liver disorders. Management of liver disease is still a challenge to modern medicine. Modern medicines have little to alter alleviation of hepatic ailments whereas most important representatives are phytoconstituents. Many unknown and lesser known plants are used in folk and tribal medical practices in India. For further research:

- Extensive analysis of the extracts of the plants *Acalypha communis mularg.* and *Lindera communis hemsl* and their flavonoids biosynthesis and diversity may be carried out.
- Further purification, formulation of fixed dose combinations, clinical investigation and marketing of the extracts compounds may be carried out for the management of liver diseases.
