ACKNOWLEDGEMENTS

Before I present the work I would like to acknowledge with a deep sense of gratitude all the help received by me.

This work is the outcome of the work carried out under the guidance of Dr. S.K.G. Sundaram, Professor and Head, Department of Economics, S.N.D.T. University. I am extremely grateful to him. His competent suggestions, kind encouragement and critical appreciation have led me to the completion of the work. But for his able guidance I would never have been able to complete the work.

I must not forget to mention Dr. Sulochana Nadakarni under whose guidance I first enrolled my name. She helped me a lot in the initial stages. When I found it difficult to keep in constant touch with her due to the fact that I was working full time at Bombay and she at Pune, she was very kind to allow me to change my guide. I am greatly indebted to her for her kind understanding of my problem.

I feel greatly indebted to the University grants commission for helping me financially under its "Minor Research Grants" scheme.
I would never forget the respondents who made the completion of this project a real success. But for their willing co-operation, their frankness in answering even the most personal questions and their readiness to spare their valuable time for me, the project could not have been carried out at all. I also acknowledge with thanks the co-operation rendered by all the administrative staff and heads of the two medical hospitals, the various primary and secondary schools and the municipal offices where I conducted the interviews.

I am specially indebted to the Deputy Municipal commissioner for his kind permission for this study.

The computer section of BMC, was very much helpful in supplying the names of women workers in the required age group. The computer section of Tata Institute of Social Services analysed the data very efficiently in a short time. I am also thankful to "Turning Point", Nashik, for doing the word processing of my thesis with speed and accuracy.

Library work is the foundation of any good research and I find no words to thank the S.N.D.T. and Bombay University Libraries. I owe special
thanks to the library of the International Institution of Population Sciences where I could get many valuable references that I wanted. I am particularly indebted to the Computer Section of the S.N.D.T. University for their "info-alert" services.

The help which was received on all these fronts could not have resulted in the present thesis without the help of my family members. The help and co-operation which I received from my husband Shri. Chandrashekhar Nerurkar and my sons Ashay, Anil and Pravin in sharing my tensions and enthusiasm throughout the study is something that I will never forget. I would not like to hurt their feelings by thanking them.

My dear eldest sister, Ambu Achyut Dabholkar, who inspired me in the initial stages of the research, as through all my life, is, unfortunately, no more. I dedicate this work to her.
