FUTURE SCOPE

Present study confirmed that hydro alcoholic extracts of *L. linifolia*, *C. reflexa*, *F. racemosa* and *S. trifoliatus* extracts were found to be significant antiasthmatic activity. In future research these extracts should be used in herbal formulation as antiasthmatic as individual or in combinational therapy. Preparation of formulations and its stability studies will be area of research in future.

Further the extracts were evaluated for possible constituent responsible for the activity and locating the active compound is having better scope in order to establish synthetic route for its bulk synthesis.
