PREFACE

Since Landsteiner discovered the blood groups, a vast amount of work has been carried out mostly in western countries, especially in the past two decades. Several new factors were discovered, notable among these being the Rh factor discovered in 1940. The importance of blood groups in clinical medicine, medical jurisprudence, genetics and anthropology is unquestionable. The work done in this country on this subject is still insufficient for the establishment of concrete data. Hence this work has been undertaken by the author as a quantal contribution for such data.

I take this opportunity to thank the Government of Madras for awarding me the Fellowship in Physiology which enabled me to carry out this work.

I thank Dr. C. V. Vareed, formerly Professor of Physiology, Stanley Medical College, and Dr. C. Venkatramiah, Professor of Physiology, Stanley Medical College, for their encouragement, guidance and supervision, throughout this work.

I am indebted to (1) The Director of the King Institute, Guindy for the supply of anti-A and anti-B grouping sera, (2) Dr. Meurant, Director, Blood Group Reference Laboratory, London for the supply of anti-A, anti-M and anti-N sera, and (3) Dr. G. V. Subba Rao and Dr. D. J. Reddy who have been kind enough to procure for me the anti-Rh serum.

I cannot fail to thank the staff of the Blood Bank Section of the Stanley Medical College, for their kind co-operation.

Finally I wish to thank, Dr. Anantanarayana Aiyar, Principal, Stanley Medical College for giving me the necessary facilities in the college to conduct this work and for giving me statistical figures for the main blood groups, for South Indians.
