List of Figures

2.1 The naive phase diagram of QCD matter by Cabibbo and Parisi ............................................ 38

2.2 A more complex phase diagram for QCD matter conceived by G.Baym in 1982 ......................... 39

2.3 A recent QCD phase diagram by Fukushima and Hatsuda ..................................................... 40

3.1 Equations of state for quark matter - A comparison between SCQGP EOS evaluated for $B^{1/4} = 200$ MeV and the MIT BagModel EOS for non-interacting quarks with $m_u = m_d = 0, m_s = 150 MeV$ and $B^{1/4} = 145$ MeV. ...................................................... 57

3.2 Mass- radius relationship for quark stars - A comparison between SCQGP EOS evaluated for $B^{1/4} = 200, 210, 220$ MeV and the MIT BagModel EOS for non-interacting quarks with $m_u = m_d = 0, m_s = 150 MeV$ and $B^{1/4} = 145$ MeV. ...................................................... 59
3.3 Mass sequences - A comparison between SCQGP EOS evaluated for $B^{1/4} = 200, 210, 220$ MeV and the MIT BagModel EOS for non-interacting quarks with $m_u = m_d = 0, m_s = 150$ MeV and $B^{1/4} = 145$ MeV.

4.1 (a) Oscillation periods ($\tau$), calculated for the SCQGP EOS, as a function of central energy density ($\epsilon_c$) for the fundamental mode
(b) For the first excited mode

4.2 (a) A comparison of oscillation periods ($\tau$), calculated for the SCQGP EOS and the MIT BagModel EOS, as a function of stellar mass $M$ for the fundamental mode.
(b) For the first excited mode

4.3 (a),(b),(c) The ‘relative eigenfunctions’ $\xi/r$, for the SCQGP EOS, plotted against the ‘relative radius’ $r/R$ for the fundamental ($n=0$), first ($n = 1$) and second ($n = 2$) excited modes respectively.

4.4 The variation in the adiabatic index $\gamma$ with energy density $\epsilon$ for the SCQGP equation of state with bag parameter $B^{1/4} = 210$ MeV.
4.5 (a) The neutrino luminosities (L), in the fundamental mode for SCQGP stars with bag parameter $B^{1/4} = 210MeV$, as a function of time. The normalization parameter $\Delta = 0.01$.

(b) The temporal evolution of pulsation energy in the fundamental mode for SCQGP stars with bag parameter $B^{1/4} = 210MeV$, as a function of time.
List of Tables

3.1 The limiting mass ($M_{\text{max}}$) of quark stars in the SC-QGP model for different B values. The corresponding radius (R), central energy density ($\epsilon_c$) and quark number density ($n_c$) are given . . . . . . . . . . . . . . . . 60
