Chapter-11

LIMITATIONS OF THE STUDY

1. In this study correlation of antioxidants and autonomic functions was done with controls, so the effect of previous treatment was not assessed.

2. Follow up study of these antioxidants and autonomic functions was not performed.

3. This was a hospital based study in which possibly severe cases of depression are more likely to be included; therefore this data may not be generalized to all patients with depression in community.

4. As all the cases in the study and control group are males, findings of this study may not be fully indicative of similar changes in females.

5. Age group less than 22 year and more than 55 years were not considered.
