CONTENTS

Part - I 1

1. INTRODUCTION ................................................................. 2
   1.1 Brief outline of sugar industry .................................. 2
   1.2 Composition of sugar cane ...................................... 3
   1.3 Composition of cane juice ...................................... 4
   1.4 Method of sugar manufacture .................................. 14
   1.5 Color problem in sugar industry ............................. 17
   1.6 Objective of work ................................................... 20

2. REVIEW OF LITERATURE .................................................. 22
   2.1 The coloured substances formed by sugar degradation product .... 22
   2.2 Colour status in different stages in juice processing ............ 27

3. EXPERIMENTAL ............................................................... 29
   3.1 Materials and equipments ....................................... 29
   3.2 Characterization of cane juice spectrophotometrically ....... 30
   3.3 Isolation of colorant from clarified cane juice employing active carbon .................................................. 32
   3.4 Isolation of colorant from deteriorated sugar by employing active carbon .................................................... 34
   3.5 Characterization of colorant isolated from clarified cane juice employing active carbon ........................................ 34
   3.6 Comparative spectra of colorant isolated from clarified cane juice and deteriorated sugar ........................................... 36

4. RESULTS ........................................................................... 37
   4.1 Characterization of cane juice spectrophotometrically ....... 37
4.2 Clarified cane juice .......................................................... 38
4.3 Effect of pH on absorbance (420nm) of cane juice .............. 39
4.4 Effect of SO₂ on absorbance, specific conductivity and pH of
limed cane juice .............................................................. 40
4.5 Absorption and IR spectra of the colorant (humic acid) isolated
from clarified cane juice employing active carbon .................. 43
4.6 Absorbance of colorant at different pH ......................... 45
4.7 Hygroscopic nature of the colorant ............................... 47
4.8 Absorption spectra and IR spectra of colorant isolated from
deteriorated sugar .......................................................... 47

5. DISCUSSION ............................................................................. 49
5.1 Distribution of colorants in cane juice ............................. 49
5.2 Characterization of colorant isolated from clarified cane juice
deteriorated sugar and stored sugar sample ....................... 51
5.3 Physico-chemical properties of humic acid isolated from clarified
cane juice ................................................................. 55
5.4 Formation of humic acid during processing of cane juice .... 59
5.5 Effect of humic acid on sulphitation reaction ................... 63

6. REFERENCES ............................................................................ 68

PART-2 .................................................................................... 74
1. INTRODUCTION ........................................................................ 75
2. OBJECTIVE OF WORK ...................................................... 77
3. EXPERIMENTAL ............................................................... 78
   3.1 Materials and equipments ............................................... 78
   3.2 Adsorption of caramel and humic acid during crystallization... 79
4. EXPERIMENTAL .............................................................. 83
   4.2 Plot of Beer's curve ...................................................... 83

xv
### RESULTS AND DISCUSSIONS

1. Adsorption of humic acid of different origins, on sugar crystals ........................................ 89
2. Effect of pH on adsorption of colouring matter in cane sugar crystals .................................................. 91
3. Adsorption of humic acid on monovalent and bivalent salts .................................................. 95
