**FUTURE SCOPE**

High quality comprehensive care local model should be developed in low income population in India. Integrated approach to SCD with partnership that strengthen health, research, advocacy and education to support Sickle Cell Disease activities in India. We should work with Global collaborations and act as an accelerator to reduce the suffering and improve the lives of those living with SCD.

Future scope for sickle cell disease to speed up initiation of diagnosis, treatment and support mechanisms for the patients. There is a need to identify each and every patient and provide care and opportunities to them, so that they can lead a productive life. Many people do not have access to diagnosis and treatment and are dying without care. Conferences and meetings on Sickle Cell Disease needs to be arranged in the disease prevalent areas to provide knowledge to primary care providers, clinicians, nurses and staff who provide emergency or continuity care to individuals with SCD.

Present study will help to understand Indian Sicklers specially patients of South Gujarat. More research studies should be developed that will help and clarify the scope of the problem of SCD around the world. It is necessary to determine the most effective, efficient ways to treat SCD, especially in low-income settings and to implement solutions that fit the local communities. There is need to develop clinical care and research coordinating centres in country. It is now time to translate the decisions and solutions into action on the ground. Studies are needed to understand advanced pathophysiology and molecular ground of the disease.
