TABLE OF CONTENTS

CHAPTER I - INTRODUCTION
1.1. Purpose of the study.................................................................1
References.........................................................................................2

CHAPTER II - AIMS AND OBJECTIVES
2.1. Aim and objectives.................................................................3

CHAPTER III - REVIEW OF LITERATURE
3.1. Historical aspects of fibrinolytic enzymes.................................4-7
3.2. Fibrinolytic enzyme source
3.2.1. From Bacteria........................................................................8-9
3.2.2. From Fungi...........................................................................10-11
3.2.3. From Actinomycetes............................................................11
3.2.4. From other Organisms........................................................12
3.3. Microbial production of Fibrinolytic enzyme...........................13
3.4. Production of Fibrinolytic enzyme.........................................13-14
3.4.1. Production of fibrinolytic enzyme by SmF..........................14-16
3.4.2. Production of fibrinolytic enzyme by SSF...........................16-18
3.5. Purification of fibrinolytic enzyme..........................................18-19
3.6. Biochemical characteristics of purified fibrinolytic enzyme........19-20
3.7. Application of fibrinolytic enzyme..........................................21-23
3.8. Mutational studies for the improvement of fibrinolytic enzyme production .23-25
References.......................................................................................26-30

CHAPTER IV - MATERIALS AND METHODS
4. Materials and Methods..............................................................31
4.1. a. Isolation of fungi from soil samples....................................32
4.1. b. Screening of fungi strains for fibrinolytic enzyme through plate assay........32
4.1. c. Selection of isolate..............................................................33
4.1. d. Assay of crude extract of fibrinolytic enzyme.....................33
4.2. Production of fibrinolytic enzyme through submerged fermentation........34
4.2. a. Preparation of inoculum....................................................34
4.3. Optimization of fermentation conditions for biosynthesis of the fibrinolytic enzyme..............................................................35
4.3. a. Optimization of pH...........................................................35
CHAPTER V - RESULTS AND DISCUSSION

4.3. b. Optimization of temperature .................................................................35
4.3. c. Optimization of inoculums size ...............................................................36
4.4. Purification of fibrinolytic enzyme ...............................................................36
4.4. a. Ammonium sulphate fractionation .........................................................37-38
4.4. b. Dialysis ....................................................................................................39
4.4. c. Gel filtration chromatography .................................................................39
4.4. d. Ion-exchange chromatography ...............................................................39-40
4.4. e. Molecular weight determination by using PAGE .....................................40
4.4. f. Silver staining of proteins ......................................................................41
4.5. Characterization of fibrinolytic enzyme .......................................................41
4.5. a. Determination of optimum pH ..............................................................41
4.5. b. Determination of optimum temperature ................................................41
4.5. c. Temperature Stability analysis .............................................................42
4.5. d. Kinetics studies ....................................................................................42
4.5. e. Determination of metal ions and inhibitors for the inhibition of fibrinolytic enzyme production .................................................................42
4.6. Molecular characterization of fibrinolytic enzyme producing organisms ......42
4.6. a. Phenotypic Identification .....................................................................43
4.6. b. Molecular (genotypic) Identification .....................................................43-44
4.6. c. Sequencing ............................................................................................45
4.6. d. Bioinformatics analysis ........................................................................45
4.7. Process economization for fibrinolytic enzyme biosynthesis .....................45
4.7. a. Enhancement for the production of fibrinolytic enzyme biosynthesis using carbon sources .................................................................46
4.7. b. Enhancement for the production of fibrinolytic enzyme biosynthesis using nitrogen sources ...............................................................46
4.7. c. Enhancement for the production of fibrinolytic enzyme biosynthesis using metal ions .................................................................46
4.8. Comparative studies on fibrinolytic enzyme from bacterial and fungal strains (Aspergillus tamarii SAS02) .................................................................47
4.9. Application of fibrinolytic enzyme on blood clot hydrolysis (ex-vivo) .......47-48
4.10. Mutational studies of Aspergillus tamarii SAS02 ....................................48
References .......................................................................................................49-53
5.1. a. Isolation of Aspergillus tamarii for fibrinolytic enzyme production ........54-55
5.1. b. Rapid screening of fibrinolytic enzyme producers from plate assay
method.................................................................55-56
5.1. c. Selection of isolate.........................................................57
5.2. Production of fibrinolytic enzyme through submerged fermentation ........57
5.3. Optimization of fermentation parameters..............................................57-58
5.3.a. Effect of pH on fibrinolytic enzyme biosynthesis.........................58-61
5.3. b. Effect of initial temperature on fibrinolytic enzyme production ........61-63
5.3.c. Effect of inoculum size on fibrinolytic enzyme production .................64-65
5.4. Purificational studies of fibrinolytic enzyme.......................................66-67
5.4. a. Ammonium sulphate precipitation..................................................67
5.4. b. Dialysis...............................................................................67
5.4. c. Gel-filtration chromatography.........................................................68
5.4. d. Ion-exchange chromatography.......................................................69
5.4. e. Molecular weight determination of proteins by Polyacrylamide Gel
Electrophoresis (PAGE)............................................................70-71
5.5. Characteristics of fibrinolytic enzyme
5.5. a. Determination of optimum pH of enzyme activity .......................71-72
5.5. b. Determination of optimum temperature of enzyme activity ..........73
5.5. c. Analysis of temperature stability on enzyme activity....................74
5.5. d. Determination of \( K_m \) and \( V_{max} \) ........................................75
5.5. e. Effect of inhibitors and metal ions on fibrinolytic enzyme ..........75-77
5.6. Molecular characterization of fibrinolytic enzyme.
5.6. a. Phenotypic identification of Aspergillus tamarii SAS02.................77
5.6. b. Genomic DNA isolation and PCR amplification of the ITS gene ......78
5.6. c. Sequence analysis for sample- 1 (Sample-S2)...............................78
5.6. d. The Blast result Phylogenetic tree for Sample-SAS02..................79-80
5.7. Process economization.
5.7. a. Influence of carbon on fibrinolytic enzyme production...............81-86
5.7. b. Influence of nitrogen sources on fibrinolytic enzyme production ....86
5.7. c. Influence of metal ions on fibrinolytic enzyme production ..........97-102
5.8. Comparative studies of fibrinolytic enzyme *Aspergillus tamarii* SAS02 with few bacterial sp. .................................................................102-105
5.9. Blood clot hydrolysis by fibrinolytic enzyme........................................106-108
5.10. Mutational study of *Aspergillus tamarii* SAS02...............................109-111
References.................................................................................................112-116

CHAPTER VI - SUMMARY AND CONCLUSION

6.1. Summary and conclusion.................................................................117-124
6.2. Limitations of the study.................................................................125
6.3. Future directions................................................................................126

CHAPTER VIII - ANNEXURES

1. Publications.........................................................................................127
2. Certificates of oral and paper presentation
3. Plagiarism verification certificate
4. Ethical clearance certificate
