LIST OF FIGURES

1.1 General fault detection scheme employing PV model ............ 20
1.2 Equivalent PV models: (a) Single Diode and (b) Double Diode .... 21
1.3 Solution cycle for parameter identification ............................ 21
1.4 Flow diagram for the thesis work ........................................ 25
2.1 Block diagram of a typical grid connected PV system ............. 30
2.2 System Grounding for PV systems ...................................... 31
2.3 Possible fault occurrences in a PV system ............................ 33
2.4 Location wise schematic to show fault occurrence .................. 34
2.5 LG faults in PV arrays: (a) and (b) single LG and (c) double LG fault . 35
2.6 LL faults in PV arrays: (a) Intra string and (b) Cross string LL fault . 36
2.7 Arc faults in PV arrays: (a) Parallel and (b) Series arc fault ........ 38
2.8 Shade Faults: (a) Normal PV array, (b) and (c) Possible shade patterns . 39
2.9 Wiring diagram for possible fault occurrences in the DC side of PV systems ................................................................. 41
2.10 I-V and P-V characteristics in various irradiation profiles ........... 42
2.11 I-V and P-V characteristics for different module temperatures .... 42
2.12 I-V response to LG faults ..................................................... 44
2.13 I-V response to LL faults ..................................................... 44
2.14 Voltage and current waveforms in response to: a) Parallel and b) Series arc faults ......................................................... 45
2.15 Output characteristics in shaded conditions: a) I-V and b) P-V characteristics ................................................................. 46
2.16 Output P-V characteristics of a $5 \times 5$ PV array under: (a) LG, (b) LL and (c) shade faults ......................................................... 47
2.17 Connection diagrams for various protection devices: (a) OCPD, (b) GFDI Fuse, (c) RCD, (d) AFCI and (e) AFD ............................. 49
3.1 Insulation resistance measurement according to IEC 62109-2: (a) Un-grounded and (b) Functionally grounded PV system

3.2 Typical $n \times n$ PV array: (a) Different fault locations, (b) Low impedance intra string LL fault and (c) Low impedance LG fault

3.3 System behavior under faulty conditions with and without MPPT: (a-c) LL faults and (d-f) LG faults

3.4 Faults considered in the first string of the $5 \times 5$ PV array for compatibility analysis: (a) LL and (b) LG faults

3.5 Hardware prototype developed for real time testing

3.6 Experimental results for LL/LG faults at different mismatch impedances without MPPT: (a) $7\Omega$ and (b) $7.5\Omega$

3.7 Experimental results for LL/LG faults at different mismatch impedances with MPPT: (a) $7\Omega$ and (b) $7.5\Omega$

3.8 Experimental results for LL/LG faults at different mismatch impedances with MPPT in a $5 \times 3$ PV array: (a) $12\Omega$ and (b) $13.5\Omega$

3.9 GFDI and OCPD currents for $7\Omega$ fault in varying irradiation levels

3.10 Experimental result for $7.5\Omega$ fault in various irradiation levels

3.11 Practical fitness analysis on advanced fault detection techniques

3.12 Comparative evaluation of advanced LL/LG fault detection approaches

4.1 Typical $5 \times 3$ PV array: (a) Healthy, (b) LG fault and (c) LL fault

4.2 I-V characteristics of the PV array: Transition from normal to faulty operation

4.3 P-V characteristics of the PV array: (a) Normal, (b) Faulty with low mismatch level and (c) Faulty string with high mismatch level

4.4 P-V characteristics of the PV array: (a) Uniform irradiation and (b) Partially shaded conditions

4.5 Different PSCs considered for identifying the right most peak in the output characteristics

4.6 Output characteristics under PSCs: (a) P-V characteristics of different PSCs, (b) I-V characteristics of case a and (c) case b

4.7 Output P-V characteristics of LL and LG faults: (a) Faults in STC and (b) Special cases
4.8 Identifying undetectable zone in high voltage PV systems ........ 89
4.9 I-V characteristics (a) and P-V characteristics (b) for temperature variations ................................................................. 91
4.10 Flowchart for the proposed detection algorithm implemented in P&O MPPT ................................................................. 93
4.11 Experimental results: (a), (c) and (d) Transition from uniform to uniform irradiance cases and (b) Operating behavior of P&O ............ 95
4.12 Experimental results for identification of partial shading: (a) PSC1, (b) PSC2, (c) PSC3 and (d) PSC4 ........................................ 96
4.13 Experimental results for identification of LL and LG faults in standard test conditions: (a) LG1, (b) LG2, (c) LL1 and (d) LL2 .............. 97
4.14 Experimental results for identification of LL and LG faults in low irradiation levels: (a) LG3 and (b) LL3 ............................................. 98
4.15 Experimental results for identification of LL and LG faults in partial shading conditions: (a) LG4 and (b) LL4 .............................. 99
4.16 Experimental results for temperature variations: (a) 25°C to 26°C and b) 55°C to 60°C ................................................................. 99
4.17 6-Axial representation of performance parameters for comparison ... 101
5.1 Typical $n \times n$ PV array without blocking diodes: (a) Healthy and (b) Characterized by LG/LL fault ............................................. 106
5.2 Typical $n \times n$ PV array with blocking diodes: (a) Healthy and (b) characterized by LG/LL fault ......................................................... 107
5.3 Existing sensor placement strategies: (a)-(c) Conventional and (d) Proposed by Hu et al. (2015) ......................................................... 109
5.4 Proposed sensor locations for LL/LG fault detection: Generalized arrangement ............................................................................. 109
5.5 Proposed sensor locations for $5 \times 5$ PV array: (a) Normal and (b) LL/LG fault condition ................................................................. 111
5.6 LL and LG faults considered in the 1st PV string for testing: (a) LL and (b) LG faults ................................................................. 112
5.7 Simulation results for the proposed sensor arrangement at various fault mismatch levels without MPPT without blocking diodes: (a) 7Ω, (b) 7.5Ω, (c) 8.5Ω and (d) 11.2Ω faults ........................................ 113

5.8 Simulation results for the proposed sensor arrangement for faults in the last string: (a) Normal operation and (b) 8.5Ω fault in the last string ... 113

5.9 Simulation results at various fault mismatch levels without MPPT with blocking diodes: (a) 7Ω, (b) 7.5Ω, (c) 8.5Ω and (d) 11.2Ω faults .... 114

5.10 Simulation results for the proposed sensor arrangement at various fault mismatch levels with MPPT without blocking diodes: (a) 7Ω, (b) 7.5Ω, (c) 8.5Ω and (d) 11.2Ω faults ........................................ 115

5.11 Simulation results at various fault mismatch levels with MPPT with blocking diodes: (a) 7Ω, (b) 7.5Ω, (c) 8.5Ω and (d) 11.2Ω faults .... 116

5.12 Simulation results for 11.2Ω LL/LG fault at various irradiance levels: (a) 400 W/m² and (b) 200 W/m² ........................................ 117

5.13 Simulation results for 11.2Ω fault with high line impedances: (a) 10 and (b) 30Ω ................................................................. 117
