List of Tables

Table 1 14
Recent studies on some of the aquatic plant species and the markers used for assessing genetic diversity.

Table 2 27
*Nymphaea* species with their respective specimen voucher, place of collection, and GPS readings.

Table 3 28
*Nymphaea* species investigated with their respective sampling numbers. For sequence data (*ITS, trnK, matK, rbcL*), numerical figures represent number of sequences generated.

Table 4 48
Qualitative characters and their character states.

Table 5 50–52
Quantitative characters and their character state codes. Using multiple range tests, the homogeneous groups identified were translated into character state codes. For *N. advena*, character information available in literature (Lippok *et al.*, 2000; Padgett, 2007) was used to code character states.

Table 6 55
Matrix of qualitative morphological characters

Table 7 56
Matrix of quantitative morphological characters

Table 8 62
Data on polymorphism for 6 RAPD primers used to assess genetic diversity of *Nymphaea* species.

Table 9 63
Genetic variation statistics for all loci (mean ± SD) estimated using POPGENE

Table 10 63
Estimation of gene flow (Nm) among sympatric species of different communities using POPGENE
Table 11  Analysis of molecular variance (AMOVA) under four alternative groupings using Arlequin

Table 12  GenBank accessions numbers of the generated nucleotide sequences of the ITS, trnK, matK, and rbcL of the different Nymphaea species studied. Sequence data of N. advena was retrieved from GenBank.

Table 13  Sequence characteristics of the ITS region and matK gene

Table 14  Sequence characteristics of the chloroplast rbcL gene and trnK intron

Table 15  Comparison of the association (A) between subgenera and bootstrap value (BV) among single and combined dataset for NJ and MP based phylogenetic methods.

Table 16  Comparison of the association (A) between subgenera and bootstrap value (BV) among single and combined dataset for ML and BI based phylogenetic methods.

Table 17  Comparison of nucleotide positions where substitutions have occurred among the suspected parental species. Note the exact nucleotide matches between the putative hybrid "N. alba var. rubra" and N. odorata.

Table 18  Comparison of nucleotide positions where substitutions have occurred among the suspected parental species. Note the exact nucleotide matches between N. rubra and N. pubescens.

Table 19  Estimation of log-likelihood (LnL) values and parameters for each region of the matK gene using site-specific codon substitution models implemented in PAML.

Table 20  Estimation of log-likelihood (LnL) values and parameters for each region of the matK gene using branch-site models implemented in PAML selecting Nymphaea tetragona as foreground branch.
Table 21 135
Specimen voucher, place of collection and GenBank accession numbers of deposited sequences of all the four Indian *Nymphaea* species investigated. Sequence data retrieved from Genbank are also listed.

Table 22 138
Comparison of sequence characteristics for all genomic regions calculated using MEGA 4.

Table 23 149
*Nymphaea* species with their respective specimen voucher, number of samples, place of collection and GenBank accession numbers of deposited sequences.

Table 24 150
Additional taxa used in the study retrieved from GenBank.

Table 25 154
Sequence characteristics of the ITS 1 and ITS 2 regions of six Indian representatives of the genus *Nymphaea*

Table 26 176
Comparison of sequence characteristics for all genomic regions calculated using MEGA 4
