I thank Shri D. D. Mahulkar, Head, Department of Linguistics for guidance and supervision of the work reported here. Shri Mahulkar's pioneering interest in mathematical linguistics, his openmindedness towards new ideas and his perception of the potentialities of interdisciplinary work have been instrumental in encouraging me to undertake this difficult problem. I am deeply grateful to him for the sustained interest he showed in the work and for the innumerable discussions on this topic and related matters spread over a period of four years.

Sincere thanks are due also to Professor R. Narasimhan of the Computer Centre, Tata Institute of Fundamental Research, Bombay, for permitting me to attend the summer seminar held in June, 1968 on computer based linguistic studies and to use the facilities of the centre during October-November, 1968 and subsequently. While all his assistants were always ready to help, special mention must be made of Dr. S. Ramani who ungrudgingly devoted himself to programming the word counts and sentence length distributions. Only those who know the special problems of programming for linguistic studies can appreciate the extent of his help.
My thanks are due in an equal measure to the Consulate of the Federal Republic of Germany, Bombay and the German Academic Exchange Service, New Delhi for enabling me to spend about four months in Germany during the summer term of 1969 attending the lectures and seminars of Professor Glinz at Aachen. This gave me an opportunity not only to have discussions with him and his assistants, especially Dr. Brinker, but also the colleagues of Professor Fucks at the I. Physics Institute, Aachen, in particular Dr. Wickmann and Mr. H.M. Dannhauer. To Mr. Dannhauer I am indebted for programming the analysis of the phrase structure rules.

I wish to thank the Computer Centre of the Rhein-Westf. Technische Hochschule, Aachen for permitting me to attend from 14.7 to 25.7.1969 an intensive course in programming language FORTRAN.

From August to November 1966 I attended with the kind permission of Smt. Indira Bhanot a short course on statistical methods conducted by the Statistical Service Unit of the Faculty of Science, M.S. University of Baroda. To her and her colleagues in the Statistics Department, Dr. A.G. Phatak and Mr. M.L. Gupta I am very thankful for many clarifying discussions on the use of statistics in linguistics.

In the last stages of the work my colleague in the German Department Mr. Birger Maiwald, DAAD lecturer,
willingly offered his assistance as informant for checking the acceptability of transformations relating to the participles. I am grateful to him for his readiness and cooperation.
