HYPOTHESES

Based on the review of literature the following hypotheses have been proposed

1.1 Parental Extraversion (both paternal and maternal) was expected to be positively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

1.2 Perceived Parental Care (both paternal and maternal) was expected to be positively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

1.3 Parental Happiness Status (both paternal and maternal) was expected to be positively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

1.4 Parental Hope, Optimism, Forgiveness and Mental Health (both paternal and maternal) were expected to be positively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

1.5 Parental Neuroticism (both paternal and maternal) was expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

1.6 Parental Psychoticism (both paternal and maternal) was expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

1.7 Perceived Parental Overprotection, i.e. Parental Discouragement of Autonomy (both paternal and maternal) was expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

1.8 Parental Stress dimensions (both paternal and maternal) were expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.
Hypothesis

1.9 Parental Anger Experienced (both paternal and maternal) was expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

2.0 Parental Anger Expression styles (both paternal and maternal) were expected to be differentially related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

2.1 Parental Coping styles (both paternal and maternal) were expected to be differentially related to Psychological Well Being, Subjective Well Being and Gratitude of adolescents.

The degree of these associations may vary across the four possible parent-child gender dyads (i.e. Father-Son, Mother-Son, Father-Daughter, Father-Daughter).

2.2 Extraversion was expected to be positively related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

2.3 Neuroticism and Psychoticism were expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

2.4 Hope, Forgiveness, Optimism and Mental Health were expected to be positively related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

2.5 Stress dimensions were expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

2.6 Parental Care was expected to be positively related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

2.7 Anger Experienced was expected to be negatively related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.
Hypothesis

2.8 Parental Overprotection was expected to be differentially related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

2.9 Anger Expression styles were expected to be differentially related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

3.0 Coping styles were expected to be differentially related to Psychological Well Being, Subjective Well Being and Gratitude for all the groups.

3.1 Gender differences in Psychological Well Being, Subjective Well Being and Gratitude and their correlates were explored in the present study.
